Debate System (Charter)

1 Project Metadata

- Project Name: Debate System

- Project Description: A polymathic, multi-feature services that consolidate the structure of online conversations. Includes a web-client implementation.

- Data Approved: 03 Nov, 2022.

2 Businesses Case

- Current situation of debate platforms:

  - Either too minimal and not unusable (like most image board websites), or;
  - Too bloated and badly designed, and leak substantial features (like Kialo).

- Our objectives are to fulfill the both shortcomings with a platform that is compatible with multi-typed midea structures.

3 Team Members

Member	Role
Mostafa Rady	Client-side development (front-end)
Abdo Muhammed	Server-side development (back-end)
Abdallah Salah	Front-end development
Salh Mohamed	Services Architecture and Deployment

4   Risk and Constrains

- In the case of the implementation of external platforms support, that might cause either complexities in performance, or constrains from those platforms (some platforms might disable the content out of their domain)

5   Expected Goals

We are anticipating having a semi-complete platform with an appropriate user interface, that fulfills the mentioned shortcomings.

6   Scope Description

- In Scope:
    - Interactive debate management that supports interactive arguing.
    - Quoting, arguing and response support.
- Out of scope:
    - Chat support.
    - External platforms conversations support.
